Good ol' Sockets

- for free version of Unity –
- supports iOS & Android -

by

User Manual

General information

Good ol' Sockets is a drop-in substitute for System.Net.Sockets namespace subset. It is designed to make it possible for Unity developers to use sockets on Android and iOS platforms without a Pro license. It also includes an automatic patcher tool that allows converting popular assets (such as **Photon Networking**, **Tasharen Networking**, **UniWeb**, **BestHTTP** and others) in a single click!

Good ol' Sockets aim to replicate the API of .NET sockets as close as possible. What this means for you is that you can use pretty much any code that uses

System.Net.Sockets, including MSDN and hundreds of tutorials over the Web. Two simple commented demo scenes are also included in the package.

Note: Good ol' Sockets is a bit slower than native Unity implementation, and do not implement whole System.Net.Sockets and System.Net namespaces. However, this won't affect most applications, as sockets are rarely the bottleneck, and the chosen API subset is sufficient for almost any needs.

Plugin is tested in Unity 4.x - 5.x. Android and iOS platforms are supported, Pro license is not required.

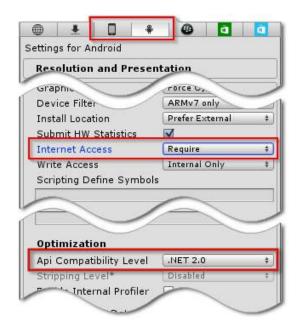

Integration

The process of integrating *Good ol' Sockets* is as simple as it can be.

Good ol' Sockets requires some specific player settings to be set in order to function. If incompatible settings are detected, a settings validator dialog will appear, allowing you to fix the settings in a single click. You can also run the settings validator by using:

Tools \rightarrow Lost Polygon \rightarrow Good ol' Sockets \rightarrow Check for Incompatible Settings

You can also set the correct settings manually. First, go to *Build Settings...* \rightarrow *Player Settings* \rightarrow *Other Settings* and set "Internet Access" to "Require". Second, set "Api Compatibility Level" to ".NET 2.0".

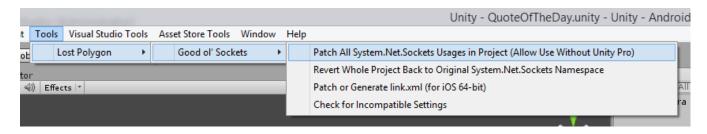

After that, when you import anything that uses System.Net.Sockets namespace, a dialog window will appear, allowing you to replace System.Net.Sockets (which is not supported without Pro license) with our own. Click OK, and that's it!

You can call the automatic patcher manually by using:

 $Tools \rightarrow Lost Polygon \rightarrow Good ol' Sockets \rightarrow Patch All System.Net.Sockets Usages$

Or you can also patch a single file or a whole directory by using "Assets/Good ol' Sockets" context menu.

In case of any problems with automatic patcher, or in case you are writing your own socket code, just prefix a namespace usage with "LostPolygon" like this:

C#

When building for 64-bit iOS using the IL2CPP runtime, a link.xml file will be created. It is required to avoid stripping of networking classes, as stripping is always enabled when using IL2CPP. More information on link.xml file can be found here.

Reverting the patch

It is also possible to revert the patching process. This is sometimes required when you want to build for a platform that is not supported by *Good ol' Sockets* (Web Player or Windows Phone, for example). In that case, revert the changes by using:

Tools \rightarrow Lost Polygon \rightarrow Good ol' Sockets \rightarrow Revert Whole Project Back to Original System.Net.Sockets Namespace

and you'll be able to build your project again.

A bit of clarification: there are no problems with building for Web Player and Windows Phone, but you'll have to do patching/reverting when switching platforms, as Good ol' Sockets only directly supports iOS and Android (Editor and Standalone are also supported for debugging purposes). The process is like this:

- 1. When you want to build for Web Player (or any other platform that is not supported), you have to revert the patch, basically disabling Good ol' Sockets, and the build will use the regular built-in sockets.
- 2. When you want to build for iOS/Android, you have to apply the patch, so the build will use the replacement sockets, allowing the build to succeed in the free version of Unity.

Known issues

Issue: On Mac OS X, building the project from MonoDevelop fails with a compiler crash. **Solution:** This happens because MonoDevelop uses a different version of Mono compiler on Mac OS X by default. That compiler has issues with *Good ol' Sockets* library. The solution is to use Unity's built-in compiler instead. To do that:

- 1) Open MonoDevelop.
- 2) Go to Preferences \rightarrow Projects \rightarrow .NET runtimes.
- 3) Add a new runtime with path "/Applications/Unity/Unity.app/Contents/Frameworks/Mono".
- 4) Set that compiler to be the default one.
- 5) Go to $Project \rightarrow Active Runtime$ and select Mono 2.6.5 Unity runtime.

Issue: My networking code crasheson 64-bit iOS.

Explanation: Unity uses IL2CPP runtime for building on 64-bit iOS. This runtime is new and has some issues, especially with sockets. If you encounter a bug or incorrect behavior, please build your project using the Mono runtime first. If it works fine with Mono runtime, then it's likely that the issue is on the Unity side, and Good ol' Sockets actually works fine. In that case, please direct all bug reports to Unity Technologies support.

Known incompatibilities

• uLink (reportedly works on Android, but not on iOS)

Implemented System.Net.Sockets counterparts

This is a list of .NET classes, structures and enumerations that are mirrored in *Good ol' Sockets*. You can use this list as a documentation reference – just Ctrl+Click to open your browser at the corresponding MSDN documentation page.

System.Net.Sockets.AddressFamily

System.Net.Sockets.IOControlCode

System.Net.Sockets.IPv6MulticastOption

System.Net.Sockets.IPPacketInformation

System.Net.Sockets.LingerOption

System.Net.Sockets.MulticastOption

System.Net.Sockets.NetworkStream

System.Net.Sockets.ProtocolFamily

System.Net.Sockets.ProtocolType

System.Net.Sockets.SelectMode

System.Net.Sockets.SendPacketsElement

System.Net.Sockets.Socket

System.Net.Sockets.SocketAsyncEventArgs

System.Net.Sockets.SocketAsyncOperation

System.Net.Sockets.SocketError

System.Net.Sockets.SocketException

System.Net.Sockets.SocketFlags

System.Net.Sockets.SocketInformation

System.Net.Sockets.SocketInformationOptions

System.Net.Sockets.SocketOptionLevel

System.Net.Sockets.SocketOptionName

System.Net.Sockets.SocketShutdown

System.Net.Sockets.SocketType

System.Net.Sockets.TcpClient

System.Net.Sockets.TcpListener

System.Net.Sockets.TransmitFileOptions

System.Net.Sockets.UdpClient

System.Net.EndPoint

System.Net.IPEndPoint

System.Net.IPHostEntry

System.Net.IPAddress

System.Net.CookieContainer

System.Net.Dns

System.Net.WebRequest

System.Net.WebResponse

<u>System.Net.HttpWebResponse</u>

Changelog

2.0.0:

- Initial IL2CPP support.
- Major internal improvements, edge cases are handled better now.
- Improved patcher UI, performance and compatibility.
- Added validation of player settings to make sure they are always setup correctly.
- Fixed an issue that made some methods always throw a NullReferenceException.
- Added some more specific patching routines.
- Dropped support for Unity 4.2 and older.

1.4.4:

Reverted some optimizations that introduced instable behavior.

1.4.3:

- Multithreading stability fixes.
- Fixed build for Windows Store Apps failing when Good ol' Sockets was in the project.
- Minor performance optimizations.

1.4.2:

Fixed build for Windows Phone failing when Good ol' Sockets was in the project.

1.4.1:

Multiple improvements in handling null reference parameters.

- Multithreading stability fixes.
- Added stub assemblies for Windows Store Apps platform.

1.4.0:

- Improved Unity 5 compatibility.
- Adding #define GOODOLDSOCKETS_IGNORE to the beginning of .cs file now prohibits patching that file. May be useful for libraries.
- Added specific patches for some popular assets to remove need for most manual post-patch fixes.
- Multiple performance and memory allocation optimizations.
- Fixed an error when assembly patcher found an unknown type in System.Net namespace.
- Assemblies from "Assets/Plugins/Metro/" directory won't be patched anymore.
- Resolved some UI issues.

1.3.1:

- Assemblies from "Assets/Plugins/WP8/" directory won't be patched anymore.
- Fixed incorrect type usage on Windows Phone build leading to a linker error.

1.3.0:

- Added per-directory patching.
- Much improved general .NET sockets compatibility.
- Improved Tasharen Network compatibility.

1.2.4:

- Fixed some regressions introduced in 1.2.3.
- Fixed compatibility with Tasharen Network 1.9.6b.

1.2.3:

- Fixed SocketAsyncEventArgs.Completed event being absent.
- Fixed some compatibility issues.

1.2:

- Added an option to revert the namespace patch.
- Added System.Net.CookieContainer support.
- Improved demos.

1.1.3:

Fixed SocketAsyncEventArgs.Completed event.

1.1:

• Fixed some compatibility issues.

- Fixed build on Windows Phone platform.
- Improved assembly patcher.

1.0:

• Initial release.
